

ABSTRACT

A method for estimating the resemblance of various  
5 objects comprises the step of recording (40) data of a  
real object using a communication device. Furthermore  
the following steps are included: transferring (41) said  
recorded data to a service server, extracting (42) a com-  
parison object from said recorded data, making (43) a  
10 resemblance analysis between the comparison object and  
a previously stored object, and transferring (44) result  
data containing information about the resemblance ana-  
lysis to a result unit.
